	examples illustrated extreme cloudy conditions as was expected in the
	middle of the afternoon. mentioned that it was very
25X1A	middle of the afternoon. mentioned that it was very
	difficult to study past data and predict with any kind of accuracy
	this in part was pecause of the finites
•	number of stations and the times of day during which the information
	was collected. passed around for review pictures of the
25X1A	was collected. passed around for review pictures of the
	first few days of each month in 1967 taken by the ESSA satellite
	-tich confirmed the extremely cloudy conditions. He mentioned that
	he had made numerous comparisons correlating photograph prediction
.7	data and actual read out from KH-4 photography at TOPOCOM and found
	that the correlation between predicted clear and actual clear was
	very low.
	d. Principal points of discussion follow:
	11 from the films
25X1A	(1) mentioned that one could see from the films
ZOXIX	that cloud free conditions were much better in the early morning,
25V1A	Legid that this was true in many areas but not for
25X1A	mentioned that he could
25X1A	determine from various data the most appropriate time of day for cloud
	determine from various data the most appropriate time of day 100
	free conditions, area by area.
·	
25X1A	raised the question as to whether it was feasible
23/1/	to consider a trade off between the best time of day for MC&G over
	particular regions compared to optimizing on priority targets for
	intelligence purposes. Indicated that data could be
25X1A	intelligence purposes. indicated that data could be
	developed for this comparison however, the trade off evaluations would
. 4	not be done by NRO but by COMIREX and/or USIB. It was mentioned that
	the MCSC Working Group had altered the minimum sun angle which had
	been proviously established with good weather areas in mind, it was
4.	concluded that it was much more important in the tropical belt as
05)/44	suggested by to photograph whenever imagery could be
25X1A	1 ti white report to everyone
25X1A	seen. asked that while this seemed apparent to everyone
	and NRO had been keeping this in mind, it would be better for the MC&G
	Working Group to revise the criteria for the tropical belt.
25X1A	of NRO explained that the group should bear
23X IA	in mind that weather predictions available to NRO were on a rev by rev
	basis and on a planning basis. The planning data as received from
	basis and on a planning basis. The product to five day projection.
	ESSA and other sources is prepared for a one day to five day projection,
	where as, the rev by rev predictions are prepared using data that is
	three to four hours old.
	(4) Questions were raised by
25X1A	concerning photographs indicating weather in South America. They
	concerning photographs indicately were month sorred very closely with
	mentioned that the good weather per month agreed very closely with
	actual experience in obtaining photos by aircraft.

		(5) At the request of the Chairman, described	
25X1A		a number of investigations he had been making that would show a very	
		poor correlation between the weather predictions and after-the-fact	
		photography by the KH-4 system. These investigations seem to indicate	
		that there were many instances that demonstrated that photography should be accomplished even though the weather predictions indicated	
		cloud coverage. Such investigations had caused them to conclude that	
	+	photography for the highest priority intelligence targets should be	•
		taken everywhere there was enough light.	
25X1A		mentioned that much could be learned from careful examination at TOPOCOM of the coverage already on hand of the tropical belt which is presently rejected and that arrangements would be made for looking into this matter and coming up with some recommendations.	
25X1A		continues to look bad for the South America and the general tropical	
		belt regions, there were vast areas of good weather scattered in other	
		areas of the world.	
		and the state of t	
25X1A		(8) asked that the Group consider what had been explained by the NRO. It was intended that the MC&G Working	
		Crown arrive at practicable steps that might increase the use of	
	•	optical photography. He mentioned that the NRO study of the tropical	
		belt clearly supported the need for an all weather collection system	
		providing data for MC&G purposes.
